

Compatible programming languages

As communication between components is being done with HTTP/TLS JSON messages, a programmer can choose any programming language which provides JSON and HTTP client libraries.

As a mere recommendation, we suggest the following languages, depending on the workload of the component.

- **Light workload:** High level interpreted languages, like Python.
- **Heavy workload:** High level compiled languages, like Go.
- **Permanent Services:** JVM languages (like Java, Scala or Groovy) or .NET (CSharp).
