

Getting Started with flexVDI 3.1

The first step with flexVDI, and the one you do not want to miss if you just want to try it, is to make a single-host installation. This short guide will take you through the process of getting flexVDI up and running on just one host. You will learn how to install and perform a basic configuration of a flexVDI host, and install a fresh flexVDI Manager instance. The [Administration Guide](#) contains full instructions on how to add additional nodes to the cluster, and configure an external shared storage.
